"The molecular basis of a spectral shift in the rhodopsins of two species of graud from different photic environments.";
species of graud from different photic environments.";
-i. Roc. Lond., B, Biol. Sci. 254:233-240(1993).
-i. FUNCTION: VISUAL PIGMENTS ARE THE LIGHT-ABSORBING MOLECULES THAT MEDIATE VISION. THEY CONSIST OF AN APOPROTEIN, OPSIN, COVALENTLY LINKED TO CIS.RETINAL. THIS RECEPTOR IS COUPLED TO THE ACTIVATION OF PHOSPHOLIPASE.
                                                                                                                                                                            -!- SUBGELLUIAR LOCATION: Integral membrane protein.
-!- PTM: Some or all of the carboxyl-terminal Ser or Thr residues may be phosphorylated.
-!- MISCELLANEOUS: THIS RHODOPSIN HAS AN ABSORPTION MAXIMUM AT 499 NM.
-!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
Opsin subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Photoreceptor; Retinal protein; Transmembrane; Glycoprotein; Vision; Phosphorylation; Lipoprotein; Palmitate; G-protein coupled receptor. rhodopsin, a phospholipase C-directed G-protein-linked receptor.";

Plochem J. 274:35-40(1991).

-!- FUNCTION: VISUAL PIGMENTS ARE THE LIGHT-ABSORBING MOLECULES THAT

MEDIATE VISION. THEY CONSIST OF AN APOPROTEIN, OPSIN, COVALENTLY

LINKED TO CIS-RETINAL. THIS RECEPTOR IS COUPLED TO THE ACTIVATION

OP PHOSPHOLIPASE C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- PTM: Some or all of the carboxyl-terminal Ser or Thr residues may be phosphorylated.
-!- MISCELLANDOUS: THIS RHODOPSIN HAS AN ABSORPTION MAXIMUM AI 494 NM.
-!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
Opsin subfamily.

Patt: a topoisomerase II-associated protein required for faithful

chromosome transmission in Saccharomyces cerevisiae.";

Nucleic Acids Res. 24:4791-4797(1996)

-!- FUNCTION: Necessary for accurate chromosome transmission during

cell division. Interacts with topoisomerase TOP2.

-!- SUBCELLULAR LOCATION: Cycoplasmic.

-!- SIMILARITY: TO S.POMBE SPBC19G7.10C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Topoisomerase II-associated protein PAT1.

New oligopeptides comprising 2 arginine residues from degradation of proline-rich proteins, useful for preventing dental caries.

Claim 2; Page 24; 36pp; English.

The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRBs (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolised by oral bacteria for mutritional purposes, with certain bacterial species generating ammonia via the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-

Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human placenta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying sene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                       Peptide #6360 encoded by probe for measuring placental gene expression.
                                                                                                                                                       microarray; human; placenta; antenatal diagnosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ffp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
                                                                                                        Gaps

probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver. comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver.
                                                                           Single exon nucleic acid probes for analyzing gene expression in human. brains.
                                                                                                                                                                        present invention provides a number of single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, liver, cirrhosis, hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia, coronary heart disease.
                                                                                                                                 Example 4; SEQ ID NO 31599; 650pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                     Length 132;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                             Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human bone marrow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; brain expressed exon; gene expression analysis; probe; microarray; Alzheimer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer.

(I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG59930 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at Etp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                              ·.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human peptide encoded by genome-derived single exon probe SEQ ID 31538
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; single exon probe; asthma; lung cancer; COPD; ILD; chronic obstructive pulmonary disease; interstitial lung disease; familial dispathic pulmonary fibrosis; neurofibromatosis; tubercous sclerosis; Gaucher's disease; Niemann-Pick disease; Hermansky-Pudlak syndrome; sarcoidosis; pulmonary haemosiderosis; pulmonary histlocytosis; lymphangioleiomyomtosis; Karagener syndrome; pulmonary alveolar proteinosis; fibrocystic pulmonary dyskinesis; pulmonary dyskinesis; pulmonary dyskinesis; pulmonary hypertension;

probes. Also included are a microarray comprising the novel set of probes which hybridies at high stringency to a nucleic acid expressed in the human lung; measuring sene expression in a sample condidexived from human lung; measuring sene expression in a sample collection of detectably labeled mucleic acids derived from human lung measuring the label detectably bound to each probe of the array; identifying exons in a eukaryotic genome, comprising (a) array; identifying exons in eukaryotic genome, comprising (a) array; dentifying exons in eukaryotic genome, comprising (a) the eukaryotic; and (b) detecting specific hybridisation of detectably the eukaryotic; and (b) detecting specific hybridisation of detectably collabeled nucleic acids from eukaryote lung mRNA, to a single exon probe, the rangement identical to the predicted exon, the probe is included in the above amed incorarray; assigning exons to a single gene, comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in the expression of the exons in the tissues and/or cell types using hybridisation to a single exon microarray having a probe with the exon, where a common pattern of expression of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single gene, a peptide comprising one of probes/open reading frames (ORF). The probes are used for gene expression of the exons in the tissues and/or encoded by the probes/open reading frames (ORF). The probes are used for gene expression clustering the mans of the exons in a gene, particularly using human clung desames (ILD), familial idopathic pulmonary fibrosis, pulmonary interstitial lung disease (ILD), familial idopathic pulmonary disease (OCDD), interstitial lung derived mRNA syndrome, fibrocystic pulmonary disease (OCDD), interstitial lung derived manalysis, pulmonary hypertensis, pulmonary hypertensis, pulmonary hypertensis, pulmonary hypertensis, pulmonary hypertension and hyaline membrane disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; NOVX, cytostatic; cardiant; antiinflammatory; immunosuppressive; antiallergic; haemostatic; anti-HIV; antidiabetic; antiarteriosclerotic; antiallergic; haemostatic; antidiabetic; antiarthritic; hepatotropic; neuroprotective; nootropic; antibacterial; virucide; antiparsatic; relaxant; anticonvulsant; hypotensive; vasotropic; antiparsatic; vulnerary; angiogenic; antiangiogenic; gene therapy; vaccine; cancer; cardiomyopathy, atheroselerosis; hypotrension; diabetes; inflammation; autoimmune disorder; allergy; blood disorder; AIDS; obesity; asthma; acquired immunodeficiency syndrome; nephropathy; cirrhosis; arthritis; Alzheimer's disease; Parkinson's disease; goirre; infection; stroke; muscular dystrophy; epilepsy; wasting disorder; chromosome 12.

ACF03547 to ACF03570 encode the human NOVX proteins (I) given in ABR57412 to ABR57435. (I) have cytostatic, cardiant, antiinflammatory, nootropic, immunosuppressive, antiallargic, haemostatic, antibacterial, viruoide, antiartritic, hepatotropic, antiasthmatic, nephrotropic, viruoide, antiparasitic, anticonvulsant, hypotensive, vasotropic, antiparasitic, anticonvulsant, hypotensive, vasotropic, antiparkinsonian, antiparasitic, anticonvulsant, hypotensive, vasotropic, antiparkinsonian, cynlogenic and antianglogenic activities, and can be used in gene therapy and vaccines. The NOVX polypeptides and their antibodies can be used to determine the presence or absence of (I) in a sample. The NOVX polypeptides, polymoral and antiabodies and antibodies against them, are useful in manufacturing a medicament for treating or preventing a syndrome associated with a NOVX-associated disorder such as hypertension, autoimmune disorders, allergies, blood disorders asthma, inflammation, autoimmune disorders, allergies, blood disorders, obesity, acquired immunodeficiency syndrome (ADS), immunoglobulin (19)A nephropathy, cirrhosis, arthritis, Alzheimer's disease, Parkinson's disease, goire, infections (e.g. bacterial, viral, parasitic), stroke, muscular dystropity, epilepsy, and other wasting disorders associated with chronic diseases. ACF03571 to ACF03544 represent PCR primers and probes for NOVX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New NOVX polypeptide useful for preventing or treating NoVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis or diabetes, and in chromosome mapping, tissue typing or pharmacogenomics.
                                                                                                                                                                                                                                                                           M, Macdougall JR, Smithson G, Millet I, Stone DJ;

ŝ

and New human secreted proteins (SECP), useful for diagnosing, treating preventing diseases or conditions associated with the aberrant SECP expression e.g. cancer, AIDS, atherosclerosis, Huntington's disease, stroke, infections.

Claim 1, Page 222, 286pp, English.

ACT 9026 to ACC79105 encode the human secreted proteins (I) given in ABR56726 to ABR56805, designated SECP-1 to SECP-80. SECP sequences can harderic, antilaterioxuvlsant, antilatiflammaacory, nootropic, neuroprotective, cerebroprotective, anti-HIV, antiallergic and thyromimetic activities, and can be used in deme therapy. The SECP proteins and polymucleotides can be used in diagnosancy, treating and preventing diseases or conditions associated with the decreased concer, atherosclerosis), neurological (e.g. epilepsy, Huntington's cancer, atherosclerosis), neurological (e.g. epilepsy, Huntington's disease, Stroke), immune/inflammatory (e.g. AIDS, allergies) and developmental (e.g. hypothyroidism, Cushing's syndrome) disorders, or infections. They are also useful in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of SECP. The SECP or its fragments are useful in screening compounds for effectiveness as agonist or antagonist of the polypeptides, or in altering the expression of the target polymucleotide and compounds that expression of the target polymucleotide and compounds that expression of contract the activity of the polypeptide

RESULT 10
```

The invention relates to a novel method for determining if a nucleic acid is a marker for a predetermined phenotype/cell type of interest from a biological species. The method comprises performing a global comparison of a group of expressed sequence tags (ESTS) known to be expressed in the phenotype/cell type of interest with all ESTS expressed in normal tissue phenotype/cell type of interest with all ESTS expressed in the phenotype/cell of interest. A method of the invention is useful for determining whether a nucleic acid is a marker for a predetermined phenotype or cell type of interest from a biological species, preferably arbidopsis or human. The cell type of interest is an abnormal cell such as a tumour cell, and the predetermined phenotype is a stress-induced phenotype such as hyperosmotic stress or high salt conditions. A method as a tumour cell, and the predetermining the progression of colon or free invention is also useful for determining the progression of colon cancer in a human, for detecting a tumour cell. An antibody of the invention is useful for detecting the absence or presence of peptides encoded by tumour-associated markers. A polypeptide of the invention is useful as an immunogen for vaccinating an animal. The present sequence represents a tumour-associated antigen of the invention.

```
The invention relates to the human atopic dermatitis-inducing proteins, salivary acidic proline-rich phosphoprotein (PRP; ADC98216) and prolactin cinducible protein (PIP; ADC98218), and their post-translationally modified forms. These proteins are secreted by salivary or sweat glands and bind to IgB autoantibodies, thereby activating mast cells and sasophils. The invention also relates to antigenic peptide fragments of RPP or PIP; antibodies which bind to PRP or PIP; methods for diagnosing atopic dermatitis or for determining whether an individual is at risk of developing atopic dermatitis by determining the presence of PRP- or PIP-specific antibodies or immune complexes, or by quantifying histamine release; and sensitisation remedies for atopic dermatitis containing PRP antibodies are useful in diagnosing atopic dermatitis, or for determining whether an individual is at risk of developing atopic dermatitis. They are also useful in diagnosing atopic dermatitis. They are also useful in developing sensitisation remedies for the treatment of atopic dermatitis. The present sequence represents the specifically claimed human salivary acidic proline-rich phosphoprotein (PPP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Atopic dermatitis-inducing proteins, applicable in diagnosis of including risk of onset, and in developing sensitization remedies for the disease.
                                                                                                                                                           Human, salivary acidic proline-rich phosphoprotein, PRP, autoantigen, aropic dermatitis-inducing protein, salivary gland, igs autoantibody; immunoglobulin E; mast cell activation; basophil activation; diagnosis; risk aggessment; sensitisation remedy; dermatological; antiallergic;

                                                                                                                                                                                                                                                                                                                                                                      16-OCT-2003
```

Human GENSET protein SEQ ID 463

```
The present invention relates to novel GENSET polynuclectides (AB236404-
BA25621) encoding polypeptides (AB975963-ABP76368). The polynucleotides
and polypeptides are useful in screening and diagnostic assays for
abnormal GENSET expression and/or biological activity. They are also
useful for screening of compounds for treating or preventing GENSET-
related disorders, such as heavy metal toxicity, cancer, inflammatory
diseases, immune disorders, and the neuromuscular, central nervous system
(CNS), cardiovascular or gastrointestinal effects of the toxicity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New GENSET polynucleotides and polypeptides, useful for treating heavy metal toxicity, cancer, inflammatory diseases, immune disorders, and the neuromuscular, CNS, cardiovascular or gastrointestinal effects of the
                                                         Cytostatic, antiinflammatory, nootropic; neuroprotective; cardiant; gastrointestinal; gene therapy; GENSET; heavy metal toxicity; cancer; inflammatory disease; immune disorder; neuromuscular; toxicity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cytostatic; antiinflammatory; nootropic; neuroprotective; cardiant; gastrointestinal; gene therapy; GBNSET; heavy metal toxicity; cancer; inflammatory disease; immune disorder; neuromuscular; toxicity; central nervous system; cardiovascular; gastrointestinal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 70; DB 6; Length 106;

```
The present invention relates to novel GENSET polynucleotides (ABZ36404-ABZ3691) encoding polypeptides (ABP75963-ABP76368). The polynucleotides and polypeptides are useful in screening and diagnostic assays for abnormal GENSET expression and/or biological activity. They are also useful for screening of compounds for treating or preventing GENSET-related disorders, such as heavy metal toxicity, cancer, inflammatory diseases, immune disorders, and the neuromuscular, central nervous system (CNS), cardiovascular or gastrointestinal effects of the toxicity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This is the sequence of the human proline-rich saliva glycoprotein P-C which was used to synthesise an octadecapeptide (AAW03556) which has an insulin secretion promoting activity and a glucagon secretion inhibiting activity. The peptide was generated by usual peptide synthesis method and opt. contains Boc protective gps. at the N-terminal His and on the residue during synthesis. These are removed by cleavage with HCl for 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; saliva; proline-rich glycoprotein; insulin; secretion; glucagon; perfusion pancreas model; Wistar rat; diabetes

mins on ice. The insulin secretion promoting activity and glucagon secretion inhibiting activity were measured in a perfusion pancreas model in a male Wister rat. Insulin secretion was 1.78 times than normal and glucagon secretion was 0.77 times normal levels. The peptide can thus be used to treat diabetes

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 38
